

ABSTRACT OF THE DISCLOSURE

An image recording and replay apparatus can record a line drawing in stages and can reproduce the line drawing in stages so that it appears as if the line drawing is being drawn. A position input device externally takes in position coordinates from a screen. A recording device records the position coordinates taken in by the position input device in a recording medium corresponding to the order they were taken-in. An image drawing device reads out the position coordinates recorded by the recording device and draws an image by sequentially re-writing on the screen points corresponding to the position coordinates in the order in which the position coordinates were taken in by the position input device.
